

# Restart confluence on Centos 7

Once confluence is installed as a service on centos7, you can simply restart confluence like following

```
/etc/init.d/confluence restart
```

If you installed one more a confluence instance on your server, you will be able to find another file on init.d like confluence1, then what you should to restart your confluence instance is run as following

```
/etc/init.d/confluence1 restart
```
