

503 Service Unavailable Error displayed in Apache Reverse Proxy environment

If you see 503 Service Unavailable Error in Apache Reverse Proxy Environment with the perfect settings, it might be something associated with server security - it can be solved by `/usr/sbin/setsebool`

Service Unavailable

The server is temporarily unable to service your request due to maintenance downtime or capacity problems. Please try again later.

If you see above message even though your apache settings is perfect, you can try below command on your terminal:

```
/usr/sbin/setsebool httpd_can_network_connect 1
```

By the way, the above settings may not take effect when you reboot your server. So what I do is turning SELinux off to modify `/etc/sysconfig/selinux`

```
SELINUX=disabled
```

You should reboot your system to make above works
