

MySQL Query based in RegExp

MySQL supports RegExp like below

```
select * from foo where fieldname regexp '<the pattern>'
```

RegExp in MySQL is case sensitive, so you need to use a special function like lowercase or uppercase to remove case sensitivity like below:

```
select * from foo where lower(fieldname) regexp 'hello(.*?)world'
```

or

```
select * from foo where upper(fieldname) regexp 'HELLO(.*?)WORLD'
```
