

Call PHP-based server URL without its extension (.php)

If you develop software based in PHP but you don't know to show its extension(.php) like <http://foo.com/auth> instead of <http://foo.com/auth.php>, you can make your PHP page work without its extension by adding **ForceType application/x-httpd-php** on **.htaccess**

What you should do is super simple. Just add below text to .htaccess or php.ini having that PHP code.

.htaccess

```
ForceType application/x-httpd-php
```
