

Check CPU - is AMD or Intel?

In CentOS 7, CPU information is stored in `/proc/cpuinfo`, so you can implement to acquire CPU information in the system.

Below is an example how to acquire CPU information.

```
<?php

// programmed by Chun Kang (2021-01-06)

function check_cpu()
{
    $cpu_info = file_get_contents( "/proc/cpuinfo" );
    if (preg_match("/AMD/", $cpu_info))
    {
        return "AMD";
    }
    else if (preg_match("/Intel/", $cpu_info))
    {
        return "Intel";
    }
}

$cpu = check_cpu();

echo "CPU = {$cpu}\n";

?>
```
