Get local IP Address in PHP on CentOS

The easiest way to get local IP Address in PHP on CentOS is using shell command like "**hostname -I**". I tried several methods to get it, but most of them returns the wrong answer.

Followings are the example:

```php
<?php

        $ip = shell_exec("hostname -I");
        echo "local IP address={$ip}\n";

?>
```

Above sample is tested on CentOS 7.
