

vim

vim is a highly configurable text editor for efficiently creating and changing any kind of text. It is included as "vi" with most UNIX systems and with Apple OS X.

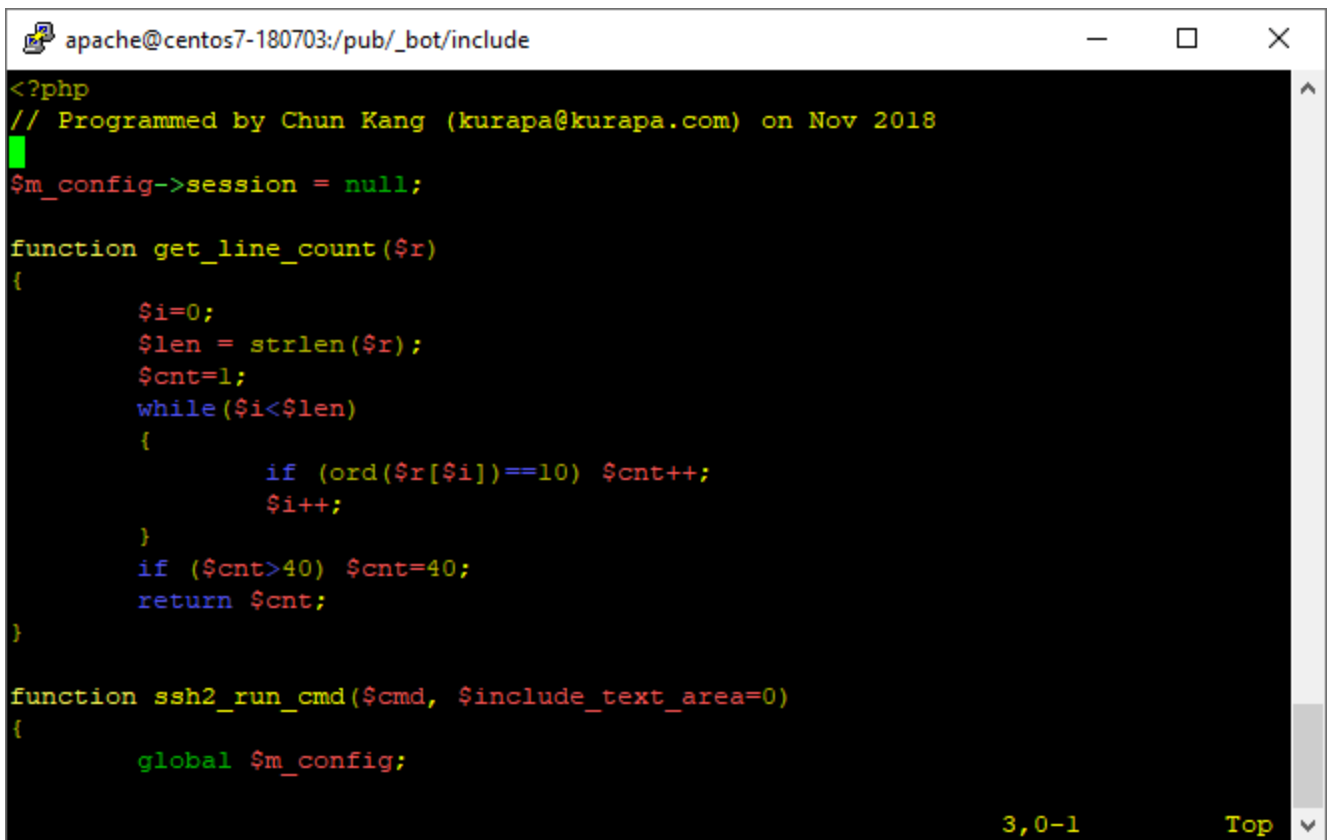

In my case, I am not to see the remark easily, so I changed its environment by creating `~/.vimrc` like below

`~/.vimrc`

```
syntax on
colorscheme slate
set encoding=utf-8
```

If you want to set above globally, you need to add above two lines at the end of `/etc/vimrc`

So eventually you will be able to see a little bit different colors like below:

The screenshot shows a Vim editor window with a dark background. The title bar indicates the user is 'apache' on a 'centos7-180703' machine, editing a file in the path '/pub/_bot/include'. The code displayed is PHP, featuring syntax highlighting: tags like '<?php' are in blue, comments are in yellow, and keywords like 'function', 'while', 'if', 'return', and 'global' are in red. Variables and strings are in green. The code includes a function 'get_line_count' and a function 'ssh2_run_cmd'. The status bar at the bottom right shows '3,0-1' and 'Top' with a dropdown arrow.

```
<?php
// Programmed by Chun Kang (kurapa@kurapa.com) on Nov 2018
$m_config->session = null;

function get_line_count($r)
{
    $i=0;
    $len = strlen($r);
    $cnt=1;
    while($i<$len)
    {
        if (ord($r[$i])==10) $cnt++;
        $i++;
    }
    if ($cnt>40) $cnt=40;
    return $cnt;
}

function ssh2_run_cmd($cmd, $include_text_area=0)
{
    global $m_config;
```

If you want other color schemes installed, you can try among below:

```
blue.vim
darkblue.vim
default.vim
delek.vim
desert.vim
elflord.vim
evening.vim
koehler.vim
morning.vim
murphy.vim
pablo.vim
peachpuff.vim
ron.vim
shine.vim
slate.vim
torte.vim
zellner.vim
```
