

Recognizing a 404 not found error in an iframe

When the iframe fails to load due to a 404 error or any other error, the 'onerror' event will be triggered, allowing you to handle the situation accordingly.

```
<!DOCTYPE html>
<html>
<head>
  <title>IFrame Error Detection</title>
</head>
<body>
  <iframe src="nonexistent-page.html" id="myIframe" width="400" height="300"></iframe>

  <script>
    const iframe = document.getElementById('myIframe');

    iframe.onerror = function () {
      console.log('Error loading iframe content.');
```

// Add your error handling code here, such as displaying a message to the user or taking other actions.

```
    };
  </script>
</body>
</html>
```
