

ExtractFileExt

Delphi provides useful filename functions for file drive, file dir, file path, file name, and file ext.

```
var
    fullFileName : string;

begin
    // Set up a full file name with drive and path
    fullFileName := 'C:\Program Files\Borland\Delphi7\Projects\Unit1.dcu';

    // Show the component parts of this full name
    ShowMessage('Drive = '+ExtractFileDrive (fullFileName));
    ShowMessage('Dir   = '+ExtractFileDir   (fullFileName));
    ShowMessage('Path  = '+ExtractFilePath  (fullFileName));
    ShowMessage('Name  = '+ExtractFileName  (fullFileName));
    ShowMessage('Ext   = '+ExtractFileExt   (fullFileName));
end;
```
